Dear Nubank Team,

I'm applying for the Technical Lead Product Designer – Crypto role with a clear focus: building crypto experiences that actually work for real people at scale.

I bring 12+ years in product design and a strong specialization in Web3. At gg.xyz, I led the end-to-end design of a crypto-native platform, creating token dashboards, reward systems, and onboarding flows designed to reduce friction for non-crypto users. My work focused on turning complex mechanics into intuitive, trust-driven experiences, something essential for mass adoption.

I'm also hands-on with the ecosystem. I won the EthereumSP Hackathon (2022), where I built a Web3 product prototype under real constraints, which sharpened both my technical understanding and product thinking in blockchain environments.

Beyond execution, I operate as a design lead. I've built scalable design systems, worked closely with engineers and founders, and helped define product direction in fast-moving environments. I'm comfortable owning ambiguity, making decisions, and pushing for clarity between business goals and user needs.

What excites me about Nubank is the scale and responsibility. You're not just building features, you're shaping how millions of people in Latin America will interact with crypto. That requires clarity, trust, and strong product thinking, which is exactly where I operate best.

I'd be glad to contribute.

Best regards,

Allan Rodrigo
