

Bug Report - Login Failure (401 Unauthorized)

MERN Stack - User Authentication Issue

Date: July 10, 2025

Summary

This week, users were unable to log in even with the correct password. The backend consistently returned a 401 Unauthorized error with the message 'Credenciais inválidas.'

Problem

Passwords were stored in hashed format, but login verification failed. Initial suspicion pointed to issues with `bcrypt.compare` or data mismatch.

Investigation Steps

- Verified frontend was sending the correct fields (email, password).
- Confirmed passwords were hashed in MongoDB.
- Checked `userController.js`: passwords were hashed before saving.
- Inspected `User.js`: found a `pre('save')` hook also hashing passwords.
- Concluded that passwords were being double-hashed (`bcrypt(bcrypt(password))`).

Actions Taken

- Removed the `pre('save')` hook from the Mongoose schema (`User.js`).
- Maintained single-point hashing inside the `userController.js` register function.
- Created a temporary `resetPassword.js` utility to manually reset affected user passwords.
- Cleaned up test users and verified login with new registrations.

Result

Login worked successfully after registering a new user. `bcrypt.compare` returned true and token was issued.
